

CHAPTER 5

Thermochemical Data

Tables I and II

The format for the presentation of the tables of data for the thermodynamic properties of inorganic compounds (Table I) and for metallic solutions (Table II) has been changed in this edition to facilitate their use. Table I presents all of the data, with some additions, which were displayed in Tables A to C2 in the 5th edition. The data for a given element or compound are now assembled together, and can be applied with simple computer programs to calculate the vapour pressures previously given in Table D and the Gibbs energy change in Table E. These latter tables have therefore been omitted from this edition.

The Table II has not been altered from the 5th edition content for metallic alloys except for the conversion to S.I. units.

We wish to express our gratitude to Dr Rajiv Doshi of the University of Notre Dame who has carried out the programming, conversion and reprinting of data in Table I and II in the form in which they are now presented.

TABLE I

Substance	$S_{298} \pm \delta S$ (J/deg mol)	$-\Delta H_{298} \pm \delta H$ (kJ/mol)	Phase	T K	$C_p = A + BT + C/T^2 + DT^2$				H_f (kJ/mol)
